Omoiotelus crocicollis Lae. Napo River.
Erotylus Debanvei De May. Between Quito and Napo. Corynomalus cinctus Fabr. Napo River.
And eighteen other undetermined species.
Notes on Orthoptera Collected by Professor James Orton on either side of the Andes of Equatorial Soutif Ayertca. By Samuel H. Scudder.

Hitherto, we have known almost nothing of the Orthoptera of the region explored by the party under Professor Orton. Chili on the south and New Grenada on the north are well represented in European cabinets, but the region midway between them has been represented in orthopterological science by a few seattered descriptions, principally of Plasmida and Blattarise. It is therefore greatly to be regretted that these explorers did not bring home something more than this mere handful of specimens, which have proved such a comparatively great addition to our knowledge of the Ecuadorian fama. A single hour's well directed search would certainly have tripled the number of species. Still we may congratulate ourselves upon what we have obtained, since thirty of the forty species cnumerated are new and require the establishment of five additional genera; of these speeies all of the Gryllides, Locnstariæ, Mantile and Forficularix, and all but one of the Acrydii are new; while only one of the four Phasmida and three of the nine Blattarix have not been deseribed; two of the genera, Tropidacris and Lophacris have not been characterized here, because they form the subject of comparison with the other gigantic Acrydians, in the succeeding paper.

## GRYLLIDES.

## 1. Nemobius Ortonii nov. sp.

Head luteons, varied above and on the vertex with dark fuscons and with two fuscons points on the front, at the base of the antennre interiorly; mouth parts pallid; antenne luteous, anoulated distantly and minutely with fuscous. Pronotum luteous, with a slight median furrow; the anterior and posterior borders with a narrow, and the middle of the sides with a longitudinal, wavy, broader line of black; the upper surface variegated with black and furnished with short black hairs; on either side of the middle, but not reaching the furrow, and sitnated just in advance of the middle, a broad naked transverse stripe, reaching the lateral black band, twice as broad above as below. Tegmina
pallid at the sides, above variegated with pallid and dark fuscous, the veins sometimes of one, sometimes of the other color; wings pellucil, the costal border and spaces exposed in folding, discolored. Legs pallid, botehed with dark fuscons; the hind femora very stout, the hind tilise abundantly armed with long spines. Anal cerci very long, stout at base, rapidly tapering, dusky, furnished with long hairs; ovipositor searcely exserted. Length of body . 44 in .; of antemar 1.25 in .; of tegmina .34 in .; of wings .62 in .; of hind femora .28 in ; of anal cerci .22 in . One 8 . Napo or Marañon.

## 2. Platydactylus fasciatus nor. sp.

Pale testaceous, the prothorax darker; head with a dusky line bordering the antemme and the cyes; first joint of antenme testaceous, beyond black; eyes large, globose, pyriform. Tegmina longer than body, testaccons with fuscous veins, the inner half with seven or eight obscure, oblique, fuscous bands nearly as broad as the spaces between; wings longer than tegmina, pellucid or slightly clonded, the costal edge fuscous, an obscure clouded longitudinal space at the apex near the bottom of the median field. Abdomen blackish above; oripositor reddish, black at tip and on the side along the median line; at base curved strongly upwards; beyond bowed slightly in a reverse direction; anal cerei stout, pale, hairy. Length of body . 85 in .; of tegmina 1.05 in .; of wings 1.27 in .; of ovipositor .62 in . One 8 . From Napo or Marañon.

## 3. Trigonidium gracile nov. sp.

Vertex of head fusco-luteous, front blackish, mouth part pale; basal two joints of antennæ blackish, beyond pale. Pronotum fusco-luteous, marked with fuscous; abdomen blackish fuscons. Tegmina dark luteous, nearly as long as the abdomen, wings blackish, with luteons veins, reaching far beyond the tegmina. Legs very slender, pale, the hind tibie with very long and slender spines on the apical half. Ovipositor reddish brown, blackish along the middle, falciform, slightly swollen at the middle, the tip upturned rather sharply and terminating in a very fine point; anal cerci very long and slenter, the basal third pale, beyond fuscous. Length of botly . 17 in ; of wings .26in.; of hind tibiæ. 16 in. ; of anal cerci $.055 \mathrm{in} . ;$ of ovipositor .07 in. One 9 . Napo River.

## LOCUSTARLE.

## 4. Steirodon quadratum nov. sp.

Head dark brown, sides of front paler; base of labrum l,lack, lobe whitish; mandibles whitish; rertex dark brown, a hand above
the eyes very dull lutcous; vertex docked squarely in front, the neek constricted; basal joint of antenna blackish, the rest reddishbrown, their apices blackish. Pronotum dull brownish fulvous, the anterior margin slightly emarginate and yellowish, the hinder margin searecly raised, broadly rounded and nearly straight, margined distinetly but narowly with black, the color extending anteriorly along the lateral carine more than one-third the way to the anterior margin; lateral carime square, sharp posteriorly; pleura marginate, especially in front. Tegmina grass green, the stridulating vein luteons, the margin next the pronotum, when at rest, black. Legs brownish yellow, hind tibiæ greenish. Length of pronotum $.31 \mathrm{in} . ;$ breadth of same anteriorly . 17 in .; do. posteriorly .26 in .; length of tegmina 2.38 in . ; breadth of same .71 in .; length of hind tibix 1.33 in . One §. Guayaquil.

## 5. Acanthodis? antennatus nov. sp.

Head smooth, green ; antenne pale green, of great length. Pronotum dull green, seabrous with frequent tubereules; front borker straight; hind border slightly produced, broadly rounded, nearly straight. Tegmina green, longer than the abdomen, shagreened with an anastomosis of irregular veins, the tip produced anteriorly to a rounded point; wings hyaline, as long as the tegmina. Legs rather stout; foramina of anterior tilix large, oblong, obovate, open; foot pads of the terminal tarsal joints largely developed. Oripositor long, broad, testaceous, the upper edge perfectly straight, basal half of blade of uniform breadth, the tip minutely pointed; anal cerci rather short, conical, luteo-fuscous. Length of pronotum 28 in.; of tegmina 1.35 in ; breadth of same .34 in .; length of antemnæ $5.8 \mathrm{in}$. ; of hind tibie $.9 \mathrm{in} . ;$ of oripositor $.7 \mathrm{in} . ;$ breadth of same .08 in ; length of anal cerci .1 in. One $\%$. Napo River.

## 6. Meroncidium conspersum nor. sp.

IIead smooth, testaccons; the summit, vertex, first two joints of antenne, borders of the antennal sockets and the lateral carine of front black; rest of antennæ reddish brown; mouth parts testaceous. Prothorax black above, and along the anterior and posterior borders at the sides, the rest testaceous; black portions very roughly seabrous with romded elevations; prosternum bimueronate. Tegmina dark testaceous, the inner border black and covered with transwerse black bars and spots; hind wings fuscous. Hind femora broad, compressed. the apieal half with five or six black spines; lind tibie armed with four rows of rather short black spines. Oripositor broad, sharply pointed, the lower edge slightly rounded, the upper edge nearly
straight, with a slight median elevation; basal half luteous, apical half and lower border black. Length of body 1.88 in.; of tegmina 2.1 in .; of hind tibie 1.26 in . ; of oripositor .87 in .; breadth of same .18 in . One 9. Napo or Marañon.

## 7. Copiophora gracilis nov. sp.

Vertical spine squarish at base, the apical two thirds conical; basal half furnished superiorly with a double row of tubercules directed forwards; inferiorly with a single prominent tuberele; above, and a little in arlvance of this on each side, a single smatler tubercle; the apex sharply pointed and turned a very little downward; front of mandible and upper erlge of clypeus black. Tegmina with a few black points along the middle. Hind femora armed along the whole inferior carina with a row of distant sharply pointed spines, curved a little ontwarls. Length of vertical spine .23 in ; of pronotum .33 in.; of tegmina 1.35 in .; of hind femora . 65 in . One 8. Napo or Marañon.

## 8. Conocephalus brevicauda nov. sp.

Stout; first four joints of antenna, sockets of antennæ, front of mandibles and upper edge of clypeus black; anternæ luteo-fuscous, distantly and narrowly ammatated with fincous; tubercle of vertex very broad, short, the front slightly romuled, the neck a little constricterl. Lateral carine of pronotum edged with blackish fuscous; pleura well rounder beneath. Tegmina rather broad, sminkled with black dots. Legs short and rather stout; ovipositor very short, sharply pointel. Length of body 1.25 in .; of pronotum . 35 in. ; of tegmina 1.7 in .; of hind femora .84 in .; of ovipositor .5 in .; breadth of same .08 in .: distance from centre of eve to tip of vertex .13 in . One 9. Napo River.
9. Conocephalus tenuicauda nov. sp.
slender, unifornly green. Tubercle of vertex short, broad, the front scarcely rounded, protuced beneath to a blunt, very short, conical tooth. Lower edge of pleura of pronotum docked angularly in front. Tegmina slender, immaculate. Ovipositor very slender, long, not very sharply pointerl. Length of body 1.1 in ; of pronotum . 29 in . ; of tegmina 1.57 in .; of hind femora .9 in ; of ovipositor .77 in .; brearth of same . 04 in. ; distance from centre of eye to tip of vertex .07 in . One \&. Napo or Marañon.

## PANOPLOSCELIS nov. gen.

Allied to Listroscelis. Hearl large, globose, the front very broad but slightly convex, with rather prominent lateral angles, the vertex
regularly and strongly convex, produced in front between the antennæ into a compressed lamina, bilaminate behind, eut transversely so as to be bidentate in front; sockets of the antennæ produced interiorly into a high rounded lamina; eyes globose, prominent; mandibles very large, hollowed exteriorly; maxillary palpi slender, last joint slightly swollen toward the apex and curved inwards, a little longer than the preceding three joints taken together; labial palpi stouter; first joint of antennæ large and stout, fully as long as the longitudinal diameter of the eye; seeond joint just half as thick, seareely longer than broad; remaining joints simple and similar. Pronotum large, divided by two deep curved furrows into three sections; the anterior two as broad as the head; the posterior much broader and produced posteriorly into a high, rounded, nearly vertical lamina, protecting the organs of flight; prosternum bimucronate. Tegmina very short, coarse and stout, produced to a broad rounded point, the of with greatly developed, laterally prominent, coarse and heavy stridulating organs; wings very short, nearly abortive; meso- and metasternum distantly bimucronate. Legs very long, very stout and very spiny; coxa heary, the angles produced to short spines, all the femora stout, the front with a double row of spines beneath, the inner the stouter, with three very large, stout and finely pointed ones on the inner surface near the apex ; the middle with a double row beneath, the anterior the stouter; the posterior with a single row beneath externally, growing larger toward the tip; fore and hind tibir with four, and middle femora with three rows of stout spines; fora-• mina of anterior tibiæ linear, very small; abdomen large, a little compressed.
10. P. armata nov. sp.

Head rugose, especially the front and sides, blackish brown; labrum and mandibles smooth; palpi and first joint of antennæ very dark mahogany brown; rest of antenne black. Pronotum blackish brown, very rugose, the posterior elge slightly marginated. Tegmina dark brown, not nearly so long as the pronotum, rugnlose; wings abortive, not half the length of the tegmina. Legs deep mahogany brown, the tarsi and all the knees darker; the bases of all the tibia externally warty, mahogany brown; spines tipped minutely with black. Abrlomen obscure, dark mahogany brown, beneath darker, the stigmata yellowish, the appemlages dull luteous. Length of basal joint of antennæ $.14 \mathrm{in} . ;$ of apical joint of maxillary palpi .29 in .; distanee from vertical spine to tip of labrum . 7 in.; length of pronotum .7 in ; of tegmina .58 in ; brealth of tegmina, exclusive of tympanam .27
in.; breadth of tympanum . $22 \mathrm{in} . ;$ length of wings $.24 \mathrm{in} . ;$ of fore tibiæ 1.25 in .; of middle tibiæ 1.15 in .; of hind tibiæ 2.03 in . One ठ. Napo or Marañon.

## DISCERATUS nov. gen.

Body curved slightly, a little compressed. Head bluntly ronuded anteriorly, the front very declivent; sockets of the antennæ with an elevated rim, and between them the vertex produced into a low crater-like elevation with a slight ridge running from it in front; upper edge of clypeus bearing, on either side externally, a rather long, cylindrical projection, curved slightly downwards and rounded at the tip ; eyes of merlium size, prominent; palpi rather short and stout. Pronotum produced anteriorly, partially covering the head; posteriorly docked somewhat spuarely, scarcely covering the mesonotum; the sides rather short, the lower edge a little rounded, higher behind than in front. Tegmina minute, wings wanting. Legs rather stont, the anterior pair long; the hind femora rather slender, not long ; coxa and sides of thoracic sterna produced into small blunt spines. Ovipositor very broad at base, curved pretty strongly, tapering rapidly, the tip pointed; anal cerei very short.

## 11. D. nubiger nov. sp.

Head smooth, front reddish, sides greenish yellow tinged with red ; vertical projection and a median line posterior to it blackish; antennæ reddish, palpi pale. Pronotum reddish brown, edged with black anteriorly. Legs testaceous, the knees slightly dusky. Tegmina blackish, with luteons veins. Abrlomen dark testaceous; ovipositor pale testaccons, bordered on the apiral half and minutely dotted on the middle of the sides of the apical half with reddish; the apex sharply pointed; anal cerci pale, very short, blunt, conical. Length of borly .95 in . ; of pronotum . 25 in . ; of tegmina .12 in . ; of fore femora . 35 in.; of hind femora .52 in .; of ovipositor .42 in. ; breadth of same at base .12 in.; length of anal cerei .06 in . One 9 . Salto, ten thousand feet above the sea, on the slope of the voleano of Antisana.

## ACANTHACARA nov. gen.

Borly eurved, slightly compressed. Head produced; the vertex prolonged into a sharply pointed, long and curved thorn; front smooth, very declivent; first and second joints of antenne large, remaining joints slender; eyes rather small, prominent, globose. Pronotum rather long, produced backwarl a little over the mesonotum, the sides short, rounded, with a broad and shallow lobe in the middle of
the posterior half; meso- and metanotum resembling the abdominal segments, unprovided with wings; the thoraeie sterna exteriorly, and the coxa internally bearing small, short, blunt spines. Legs slender, the posterior femora rather short. Ovipositor broad at base, pointed at tip (?), eurved pretty strongly; anal cerei very short, eonical.
12. A. acuta nov. sp.

Whole upper surface, from the tip of the vertical spine to the ovipositor, testaceous, with a median, blackish, frequently obsolete line from the base of the vertical spine to the penultimate abdominal segment; the sides bordered above with a dark fuscous streak from the eyes to the tip of the abdomen; under surface of vertical spine, and the space between and around the antennæ blackish; first joint of antennæ obscurely fuscons, the remainder luteons, distantly and narrowly annulated with fuscons. Legs luteous, banded and blurred with blackish fuscous; femora armed externally and internally at the tip, with a sharply pointed spine. Ovipositor reddish; anal cerci pale, rapidly tapering, pointed, sparsely pilose. Length of body. 62 in.; of pronotum .17 in ; of vertical spine .07 in .; of hind femora .38 in ; of anal cerei . 04 in. One $\%$. Between Quito and Napo.

## ACRIDII.

## 13. Proscopia bulbosa nov. sp.

Of a nearly miform griseous color. Head somewhat hour-glass shaped, above the jaws tapering, but a little swollen, to a constricted neek, above which and just below the eyes the head expands again; vertex short, as long as the width of the head below the eyes, tapering a little to a rounded apex; surface scabrous with distant elevated points, the back with a median furrow between the eyes and upwards to the tip of the rertex with a slight median earina; front, between the lower edges of the eyes, with a long, lozenge shaped hollowing, eontaining a median carina. Prothorax swollen mext the head and like the mesothorax scabrons with large, irregular, distant, raised points. Legs very slender, the hind femora greatly swollen at the base, rough with longitudinal rows of greatly elevated points; hind tibie with very minnte spines. Length of head, exclusive of the vertex . 28 in.; of vertex .04 in, ; of prothorax 42 in .; of hind tibie $1.06 \mathrm{in} . ;$ breadth of hind femora at base .09 in . One $\delta$. Napo or Marañon.
14. Proscopia sajax nov. sp.

Greenish brown, the legs paler, with dusky tips to the femora; the head with a small testaceous spot just above the base of the mandi-
bles. Head rather smooth, long, uniformly tapering to the eyes, the vertex rather long, marginate, constricted slightly between the eyes; back of the head from between the eyes half way to the prothorax with an insignificant carina; front with a slight median ridge from eyes to labrum. Thorax seabrous with irregular, elevated, rough points, becoming very short, transverse ridges on the dorsum. Legs rather slender (the hind pair lost). Length of head, exclusive of vertex $.37 \mathrm{in} . ;$ of vertex beyond eyes .08 in .; of antenne .16 in .; of prothorax .42 in .; of fore tibie .52 in . One specimen, the abdomen of which is broken, from Napo or Marañon.
15. Cephalocæma acuminata nov. sp.

Body reddish brown. Hearl smooth, forming a greatly elongated cone, just below the middle of which the eyes are hardly prominent; above the eyes the tuberele becomes quadrate; below the eyes there is a rounded frontal carina. Prothorax slightly rugose with short, transverse, impressed lines and punctures; meso- and metathorax with slightly impressed enrving lines and deeper punctures, which markings continue upon the basal segments of the abdomen, the lines becoming finer and more indistinct posteriorly. Legs slender. Length of body, exclusive of head 2.3 in .; whole length of head .8 in.; length of tuberele beyond the eves $.35 \mathrm{in} . ;$ of antennæ $.16 \mathrm{in} . ;$ of prothorax .48 in .; of mesothorax .12 in .; of hind femora 1 in . One f. Between Quito and Napo.
16. Xiphicera octomaculata nov. sp.

Brownish; antenna, excepting base, brownish fuscons; tuberele of rertex, viewed from aloove, twice as long as broad, the apex broadly rounded. Lateral carinæ of pronotum scabrous with frequent tubercules, anterior border with little raised points, posterior border less than a right angle. Tegmina, each with four long and slender, sometimes confluent, dull luteous spots, bordered heavily with black, and arranged along the costal border nearly to the tip; wings yellowish, with luteous veins and a black outer border, which is very broad at the apex and very narrow at the inner angle. Hind tibir having the inner row of spines greatly produced, in the plane of the movement of the leg, into long, nearly straight, black tipped spines, the upper ones very broad and flatly compressed at base. Length of body 1.6 in.; of tuberele of vertex $.12 \mathrm{in}$. ; of tegmina 1.52 in ; of hind femora 1 in .; of longest tibial spine .11 in . One $\delta$. Napo or Marañon.
17. Lophacris Humboldtii nov. gen. et sp.

Vertex, summit and upper portion of sides of head smooth; front PROCEEDINGE B. B. N. H.-VOL XII. 22 APRIL, 1869.
and lower portions of sides seabrous with minute pittings. Prothorax uniformly rugose, the erest very high, greatly compressed, anteriorly with four lobes, which have romnded summits, and the first of which projects considerably over the head; the anterior portion separated from the posterior by a deep but very narrow transverse excision; posteriorly there is first a single lobe nearly as large as the anterior ones, and behind it much smaller, and generally rather sharply bimueronate elevations ; posterior border of prothorax barely making a right angle; prosternal spine long, stout, straight, smooth, or slightly punetured, scarcely tapering, the tip bluntly rounded. Tegmina large and broad; wings large, evidently roseate in part, but as the insect has been immersed in aleohol, the colors have faded. Length of body 4 in.; greatest height of pronotal ridge above a line drawn from the top of the head to the hinder tip of the pronotum $4 \mathrm{in} . ;$ length of tegmina 3.6 in . ; of hind tibiæ 1.66 in . One \& from Napo or Marañon. Another of from Guayaquil, brought home in a dried state, but almost consumed by insects, seems to belong to this species. So far as can be determined, the wings are colored with a delicate shade of pea green, and the veins in the posterior half are roseate; the pronotal crest is hardly so high or so strongly compressed as in the other speeimen. The head and ovipositor of still another female, apparently of this species, were brought from Napo or Marañon.
18. Tropidacris rex nov. gen. et sp.

Head smooth abore, the vertex and a dull reddish band on either side extending to the back of the head from the upler elge of the eye, minutely punetured; clypeus and labrum dull olivaceous brown, punctured; front rugulose; lateral carinæ prominent, sides of head sparsely furnished with fine hairs. Pronotum luteo-fuseons, seabrous with elevated, rounded, whitish pọints and abbreviated lines; median earina and posterior border ellged with blaek; first and second lobes nearly comnate, elevated posteriorly more than anteriorly. Tegmina obscme brownish fuscons, marked with olivaceous on the basal half' and with pale luteous apically, the prineipal veins castaneous, the secondary veins olivaceous and luteo-olivaceous; wings red, marked with a very broad, external, blackish band, and with rows of multitudinous black spots, a aoiding the cross-veins, giving the whole wing a tessellated appearance. Hind femora marked within and without with whitish, and furnished with an arcuate band at the tip; spines of hind tibia black. Length of body 3.9 in ; of tegmina 4.34 in .; of hind femora 1.72 in . ; band on the outer edge of the wings . 36 . broad. One $\%$ Gnayaquil.

## 19. Acridium occidentale nov. sp.

Dark brown; the head smooth, with very minute, distant punctulations; froutal and lateral carine very prominent; tip of labrum and edges of mandibles whitish. Prothorax profusely punctate, the median carina very slight ; prosternal spine rather stont, long, seareely tapering, excepting at tip, straight but inclining slightly backwards. Tegmina obscure brownish, onter half semiopaque with fuscous spots; wings hyaline. Hind femora externally flat and white, the carinæ distinet, the hind tibia with black tipped spines. Length of body 2 in.; of pronotum .39 in. ; of antennæ $.68 \mathrm{iu} . ;$ of tegmina 1.23 in .; of hind tibiæ . 96 in . Two 9 . Napo or Marañon.
20. Acridium labratum nov. sp.

Head, especially the frontal ridge, punctate, brownish, the edge of the labrum and terminal joints of the palpi pale; the carina prominent; antennæ pale fuscous, darker toward the tip; eyes large, oblong, prominent, separated above by a narrow space. Pronotum brownish, closely punctate, the median carina barely perceptible. Tegmina brownish, blotehed indistinctly and abundantly with small fuscous spots; wings hyaline, with blackish veins, tinged with faint yellowish at the base, and blackish fuscous at the apical half of the costal margin. Legs brownish, tarsi edged with blackish; hind femora internally and externally flat and dark brownish fuscous, the external inferior carina yellowish; hind tibiæ armed with black tipped spines. Length of body 1.23 in . ; of tegmina 1.17 in . ; of hind femora . 66 in . One $\%$. Napo or Marañon.
21. Chrysochraon ? abbreviatum nov. sp.

Brownish yellow; head smooth; lateral carine of front distinct, prominent; median carina distinct, growing broader toward the clypeus. Pronotum docked squarely in front, broadly rounded behind, anteriorly smooth, posteriorly punctulate; median carina distinct, slight; lateral earine not prominent, marked by a black line, which extends forwards to the cye. Tegmina brownish, immacnlate, longer than the abdomen; wings pellucid, faintly nebuluse, especially, but still very slightly, at the tip ; costal margin blackish; hind tibix obscure fuscous, with pale, black tipped spines; oripositor reddish. Length of body . 6 in. ; of tegmina .5 in. ; of hind femora .42. One ¢. Between Quito and Napo.
22. Edipoda bivenosa nov. sp.

Head rather smooth, dull luteons, marked with black points and minute reddish brown blotches, arranged in irregular lines; antenuæ reddish, growing fuscons toward the tip. Prothorax finely scabrous,
less so on the anterior thind ; a distinet but not high median carina, an I di tinct. sharp, but not elevated lateral earine; posterior border forming a rigit angle, minutely bordered. Tegmian longer than the abdomen, brownish opaque, growing pellucid toward the tip, marked with blackish and blackish fuscous blotches, of which three are more prominent than the others, and are sitnated on the principal vein; the first and largest at one third the distance from the base to the apex; the second at one half that distance, and the third and smallest at two thirds that distance; the veins fuscous, excepting one prominent one in the middle of the wing, aloner the apical two thirds of the basal half, which is luteous; wings pellueid, the veins prominently fuscous, the base faintly washed with pale greenish yellow, the middle of the outer margin slightly nebulons, the basal half of costal margin a little fuseous. Legs brownish, marked with black points and furnished with black tipped spines; oripositor pale luteous, edged and tipped with black. Length of body .83 in.; of tegmina .85 in.; of hind femora .46 in. One + . Ecuador.

## 23. Amorphopa caiman Sauss.

A single f, taken between Quito and Napo, is referred with some doubt to Saussure's species.

## PHASMIDA.

## 24. Bacteria sp.

One specimen, labelled as coming from Napo or Marañon, the abdomen of which is entirely wanting, is referable to $B$. molita Westw., or B. gracilis Burm., but may not belong to either species. The middle pair of legs have both the femora and tibir very obscurely fasciated.
25. Acanthoderus immanis nov. sp.

Whole body rugose. Head with a median prominence, cleft in the midlle nearly to the base, so as to form on either side a divergent, spinulose, compressed spur, three quarters of a line in length, and backel by a strong thom. A pair of similar but erect thorns on the prothorax ; four spines, the middle two of which are scarcely smaller, upon the anterior border of the mesothorax ; from the outer edge of the middle of the mesonotum spring two strongly divergent, very stont. subconical prominences, armed at the tip with short but stout spines, and below tine tip with elevated warts; these prominences are the largest on the body, and are fully one and one third lines in length, and nearly half a line broad at base; the anterior edge of the
metathorax bears a median prominence similar to that on the head, but with the spurs searecly so divergent, and bearing at the tip longer and less frequent spinules; posteriorly the lower edge of the pleura of the metathorax is clilated into a flat, deprested, triangular, spinuliferons lamina, protecting the posterior coxe ; it is abont four fifths of a line in length. The middle of the anterior lalf of each of the first five abdominal segments supports a pair of divergent thorns, from each of which a slender spiculiferous lamina extends backwards, those of opposite sides meeting in the middle of the posterior border; the sixth abdominal segment bears a median, elevated, rugose lamina, bifurcate anteriorly, its ridge rounded and armed posteriorly with three equal, triangular, compressed teeth; behind this segment the median carina is elevated and rugose. The legs throughont, but especially the femora, are armed profusely with laminated spines; the hinder portions of the apices of the joints on the basal half of the antenne swollen. Length of body 1.2 in ; of antennæ 1.05 in . ; of hind femora .4 in . It is allied to $A$. Tisiphone Westw. One $\delta$ from Napo or Marañon.

## 26. Phasma putidum Bates.

One $\delta$, two of and one pupa from Napo or Marañon. The wings of both of the + measure 2.3 in . in length, or a little more than those of Bates's specimens.
27. P. Menius Westw.

One of taken in Ecuador seems to be refcrable to Westwood's species. The alternate joints of the antennæ are not marked at the base with a broad whitish ring, excepting in a few instances near the tip, and where the pale color extends also over the apex of the preceding joint; the centre of the tegmina is elevated into a triangular perpendicular lamina, the apex of which is rounded. The wings measure slightly more than one and a half inches in length.

## MANTIDES.

28. Stagmatoptera binotata nor. sp.

Prothorax trigonal, the lateral border with small, flattened, laterally projecting spines, those at the base of the legs smaller and more miform than the others; the spines of the fore tibir and tarsi black, except externally; a median spot on the interior surface of the tibiæ. near the point of reception of the apical tarsal spine, black. Tegmina green, a large median spot ferruginous, the inner edge in the o nearly hyaline; wings hyaline, sprinkled with numerous quadrate,
yellowish spots (perhaps greenish in fresh specimens), seated upon the eross veinlets thronghout nearly the whole wing; middle and hind tarsi blackish beneath. Length of prothorax of $1.1 \mathrm{in} .$, of 1.46 in .; of tegmina \& $1.98 \mathrm{in} .$, of 1.85 in .; of fore tibire o $.62 \mathrm{in} .$, \& .86 in . One $\delta$, one $\%$. Napo or Marañon.

## BLATTARIE.

## 29. Phyllodromia pallipes nov. sp.

Head piceous, labrum and elypeus luteous; basal three joints of maxillary palpi pale, apical two fuscous; antennæ black. Pronotum scarcely coucealing the whole of the bead, black, immaculate, minutely and rather sparsely punctulate; entire border minutely marginate. Tegmina dark castaneous, semidiaphanous toward the tip, costal edge yellowish; wings faintly fuliginous with dusky veins, costal edge, especially near tip, castaneous. Femora and tibiæ and most of the coxæe pale, the tibire suffused with yellowish brown, especially toward the apex; tarsi darker. Abdomen black; anal cerei nearly as long as the first hind tarsal joint, rather broad, pointed, black, the apex pale. Length of body, . 58 in ; of body, including tegmina, $i 6$ in. One $\delta$ from Napo or Marañon.
30. Ischnoptera melana Walk.?

My single specimen from Napo River does not wholly agree with Walker's cleseription; it is not so dark, the tarsi are not tawny toward the tip, and the tegmina show no dusky markings near the apex.
31. Periplaneta americana (Linn.) Burm. One specimen from Napo or Marañon.
32. Periplaneta australasiæ (Fabr.) Burm. Two speeimens from Napo or Marañon.
33. Panchlora exoleta Klng. One speeimen from Napo or Marañon.
34. Zetobora rudis Walk. One specimen, mlabellerl.
35. Blabera cubensis Sauss. Two specimens from Guayaquil.
36. " femorata nov. sp.

Head black, labrum and lower part of front luteons, the upper part of labrum with a transverse fuscous band; eyes separated from each other by a space greater than the length of the first antennal joint; palpi reddish brown; antennæ thick at base, tapering more rapidly than usual; first eleven joints piceous, shining, beyond dull blackish fuscous, apical third dull ferruginous, the apices of the joints tipped
above with fuscous. Pronotal shield irregularly ovate, the lateral augles equally distant from the front aud hind border, the whole border slightly marginate, but the hind border obscurely; the front border well rounded, projected forward so as just to conceal the head, the hinder half of the sides forming an obtnse rounded angle with the hind border; the hind border slightly eurved; pronotum ferruginous, whole hind border and half way to the lateral angles broadly bordered with black; a very large and broad discal spot with ill defined borders, its front broadly and deeply concare, so as to make it widely and rather sharply bilobed, with large, quadrangular, lateral expansions, and a well rounded, convex hind border scarcely reaching the marginal band; this spot encloses dull, indistinct, ferruginous markings in the shape of a $\perp$; the whole shield, and especially just in front of and behind the discal spot, minutely and transversely wrinkled. Tegmina fuliginous, paler toward the tip, with a dark fuscons, narrow, humeral stripe, becoming gradually fainter and scarcely extending over half of the tegmina; wings hyaline, costal border testaceous; legs very stout, fuscous above, fusco-luteous beneath; mesothorax and metathorax bordered above posteriorly with pale testaceous. Abdomen above uniformly dark castaneous brown, beneath ferraginous, the sides and terminal segment blackish fuscous; anal cerci short, stout, tapering, fuscous; terminal segment small, subquadrate, in my single specimen asymmetrical. Length of body 1.46 in .; of body including tegmina 1.94 in .; of antennæ 1.25 in .; of pronotal shield . 46 in . ; breadth of same .67 in . It is allied to $B$. marmorata Brunn. One $\delta$ from Napo or Marañon.
37. B. armigera nov. sp.

Head black, with two circular ferruginous spots just within the bases of the antennæ; eyes separated by a space searcely so large as half the length of the first joint of the antennæ; antennæ slender, tapering; first fourteen joints piceous, shining; beyond dull fuscous, slightly washed with luteous toward tip. Pronotal shield broadly and irregularly ovate, the whole border slightly marginate, the hinder border obscurcly so; the front border well rounded, the middle of the front scarcely produced and barely concealing the head, the lateral borders well rounded, the hind border very slightly produced and obtusely angulated; pronotum luteo-ferruginous, enclosing a large, shield shaped, piceous, immaculate spot, widely distant from the front and lateral borders, and separated from the lind border only by the very margin itself; its front border is subrect, very slightly and angularly exeavated in the middle, the upper outer angles ronnded, the spot narrowing posteriorly, its sides a little hollowed in
the middle, and its hinder border well rounded. Tegmina testaceons, the costal edge ferruginous, a narrow, black, humeral stripe of equal width throughout, searcely as long as the pronotum; apical half of the tegmina faintly tinged with fuliginons, commencing at the end of the anal field and widening posteriorly, but not including any of the costal field; wings lyyaline; costal border testaceous. Legs black; meso- and metanotum luteous, spotted with blackish fuscons. Abdomen blackish fuscous above, the sides narrowly elged with testaceous; the supraänal plate testaceous, firseous at base; abdomen below black, with some obscure dull luteous markings on the basal segments; terminal segment narrowly bordered posteriorly with ferruginous; anal cerci moderately long, tapering slightly, bluntly rounded at tip, blackish. Length of body 1.92 in .; of body including the temmina 2.58 in .; of antennæ 1.3 in .; of pronotum .52 in .; breadtl of same .75 in. It is nearly related to B. gigantea. One $\delta$. Napo or Marañon.

Other Blattariæ were obtained, but either young specimens, or too mutilated to bear description.

## FORFICULARIE.

## 38. Chelidura robusta nov. sp.

Head piceous; labrum slightly reddish; mouth parts and first and part of second joints of antennæ reddish. Prothorax, tegmina, abdomen and forceps piceous; pronotum docked squarely in front, the lateral angles square, the hind border well rounded, convex, the lateral borders slightly marginate; a finely graven median line. Tegmina short, quadrate, smooth ; upper surface and sides of abdominal segments minutely, the penultimate segment also profusely punetured. Legs brownish yellow. Foreeps stout, trigonal, beneath flat, straight nearly to the tip, the lower surface for this same distance furnished interiorly with a minute blade; the tips are bent toward each other, but not strongly. Length of body including foreeps. . 9 in .; of forceps, .2 in.; of tegmina, 12 in ; width of pronotum, . 12 in . Two ठ . Between Quito and Napo, and at Napo.
39. Psalidophora nigripennis nov. sp.

Piceous; pronotum and front of head, shining, the former bordered laterally with dull luteous. Head broader than the pronotum, smooth; the long, basal and minute, second joint of antenne black ; remaining joints, like the palpi, fusco-rufous. Pronotum quadrate, the posterior border broadly rounded; a very slight median carina. Tegmina and exposed parts of wings black, densely and most minutely punctured, and furnished with a very few fine, distant, long, ereet hairs. Femora
black, tibix and tarsi luteous. Abdomen blackish at the sides and along the posterior edges of the segments, and blackish fuscous in the middle. Length of pronotum, .05 in .; of tegmina, $.11 \mathrm{in} . ;$ of hind femora, . 12 in . One specimen (with forceps broken) was taken between Quito and Napo.
40. Labia bilineata nov. sp.

Piceons, with infrequent, short, decumbent, lustrous hairs; head minutely punctured ; basal joints of antennæ luteous; palpi blackish fuscous. Pronotum quadrate with a slight median furrow, not attaining either margin; the sides faintly bordered with dull luteous. Tegmina smooth, with a broad, pale luteons, hmmeral stripe reaching neither the outer border nor the hmmerus nor apex ; exposed portion of wings marked indistinctly with luteous on the inner ellge at the tip and near the outer border. Basal half of femora black, outer half luteons; tibix brownish fuscons, the apex paler; tarsi dull fusco-luteous, the basal joints paler; abdomen blackish, rensely punctured, the hinder edges above fusco-rufous. Forceps straight, parallel, ineurved a little at the tip, under surface flat, the inner, inferior edge denticulate. Length of body including forceps, $.34 \mathrm{in} \cdot ;$ of tegmina, .05 in .; of forceps, .06 in . One 9 , the hind legs of which are lost and the anteunæ broken, was taken between Quito and Napo.

## The following paper was also presented:-

## A Study of the Gigantic Lobe-crested Grasshoppers of Soutif and Central America. By Samuel II. Scudder.

An examination of the gigantic crested grasshoppers, mentioned in the previous paper, has induced me to review the whole group. Some errors have been detected in the work of preceding authors, showing that they have given but comparatively slight attention to these insects or to their representation by earlier writers; ${ }^{1}$ in consequence, the synonymy of several well known species, as will be seen beyond, has become greatly confused. ${ }^{2}$

[^0]
[^0]:    ${ }^{1}$ For instance, Serville and Burmeister, in quoting Drury's description and figure of Gryllus dux, copy the mistake which Fabricins makes and repeats in all his works, of referring to the first instead of the second volume of the Illustrations of Natural IIistory.
    ${ }^{2}$ This seems the more remarkable, since an examination of many scores of specimens has shown that the variability of these huge Orthoptera is comparatively slight. I have compared over fifty specimens of a single species, Tropilacris crisiata, occurring in many different localities from Surinam to Itio, and find the variation to be insignificant,-a fact which has given me greater confidence in the opinious I had formed concerning the different species.
